

Question?

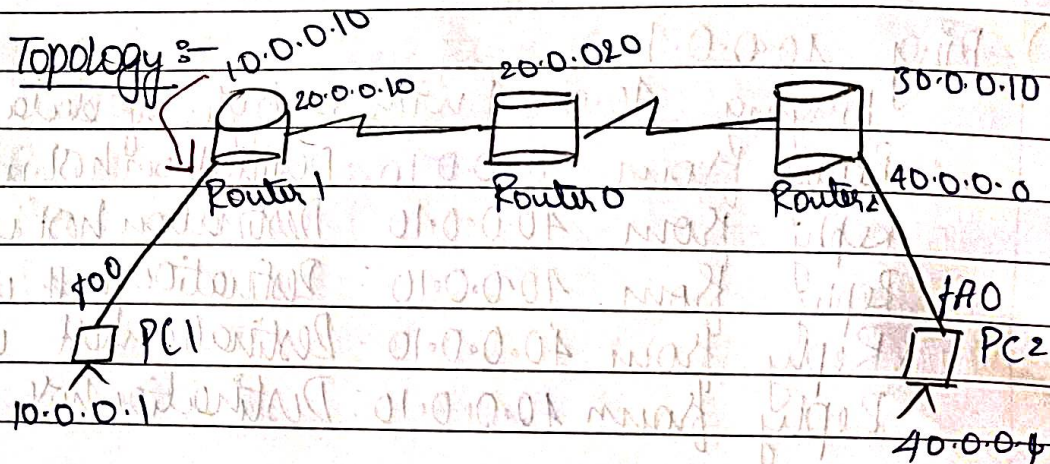

## Experiment - 3 :-

Page No.:

Date:

youva

### Default IP address :-

### Procedure :-

- Select PC's & router & configure them with suitable IP.
- Make connections to all the devices using suitable connection links.
- For the routers to link between PC's & other routers. Use CLI mode & start typing the commands.

1. > enable

2. > config t

3. > interface fast ethernet 0/0

4. > IP address 10.0.0.10 255.0.0.0

5. > No shut

Repeat these steps similarly to all the router in order to make default path.

> config t

If router destination subnet mask device

If router 0.0.0.0 0.0.0.0 20.0.0.10 similarly perform this to all the router

Show IP router inter

10.0.0.0 /8 is directly connected to fast ethernet 0/0

20.0.0.0 /8 is directly connected serial 2/0

0.0.0.0 /0 [1/0] via 20.0.0.10

Similarly all the router are connected.

Observation :-

In the previous one, we have given the IP address to all the router with destination subnet, & intermediate IP address of these particular devices, but here in this experiment we use a default IP address i.e. 0.0.0.0 & subnet 0.0.0.0 so that it can create a pass through channel to all the packets that are sent will be transferred by the intermediate device. This is generally used in large no. of device connections.
